Small-sample binary uncertainty: coverage and width
Independent binary draws, n = 16
Independent binary draws, n = 64
Exact inclusive interval coverage
Expected interval width
Population bad-outcome probability q
Bootstrap limit
Wilson
Clopper–Pearson
Nominal 95%
Exact rational probability weights; float interval boundaries. Bootstrap is the infinite-resample limit.
Markers show the declared grid; lines are guides. These are distribution calculations, not live-model results.
